To Whomsoever it may concern

Subject: Letter of Commendation — Team OrgAnalysis AI on selection to represent India at the Codeavour 7.0 International Finals, Jakarta (16–17 May 2026).

It is my privilege, to extend sincere commendation to **Team OrgAnalysis AI — Kriday Sharma, Geetisha Gupta and Arnav Chaudhary** — on their selection as National Champions of India and on their forthcoming participation in the Codeavour 7.0 International Finals at Jakarta on the 16th and 17th of May 2026.

The clinical and public-health problem the team has chosen to engage with is one that warrants serious institutional attention. India's **essential and high-risk industrial workforce** — spanning **sanitation workers, factory and manufacturing labour, construction workers, port and dockworkers, and coal and mineral miners** — numbers in the tens of millions. The available evidence indicates a substantially reduced healthy life-expectancy across this population, driven in large part by undetected cardiovascular, respiratory and dermatological morbidity, alongside heat-related illness and the accumulated effects of chronic occupational exposure. The same epidemiological pattern is now being reported across ageing labour forces in Europe, the Gulf, North America and East Asia. **Early detection — at the pre-symptomatic stage — remains among the most cost-effective interventions available in non-communicable disease control**, and is consistently identified as such within **World Health Organization** frameworks for occupational health and primary care.

OrgAnalysis AI directly addresses this gap. The team has designed a low-cost, multi-sensor monitoring device, built on an **Arduino Nano** platform with an on-device machine-learning classifier (**PictoBlox ML**), capable of tracking four physiological parameters concurrently. The reasonable unit places the device within operational reach of **municipal employers, industrial and construction contractors, port and mining operators, and primary-care providers** — a price point at which population-level deployment becomes operationally realistic rather than merely aspirational. It is precisely this combination of **clinical relevance, technical economy and scalability** that distinguishes a meaningful public-health innovation from a laboratory exercise.

Continued from previous page

The methodological approach adopted by the team — **sensor fusion, supervised learning on locally collected data, and deployment on edge hardware** — also reflects the direction in which preventive screening for non-communicable disease is itself moving worldwide. That a team at this stage of education has framed and executed the problem in these terms is, by any reasonable academic standard, exceptional, and merits institutional encouragement.

I extend warm congratulations and my best wishes to **Kriday, Geetisha and Arnav** as they prepare to present their work at Jakarta. I trust the international panel will receive their submission on its considerable scientific and humanitarian merits, and I am confident the team will represent the country with distinction.

With best wishes,

Dr Harshal Ramesh Salve
